Week 5: OCaml

So far, you learned about the following types of expressions:

- -Constants
- -Variables
- -Unary operators
- -Binary operators
- -Tuples
- -Records
- -Lists
- -If-then-else
- -Pattern matching
- -Function definition
- -Function application
- -Variable binding

For each of the aforementioned types of expressions, give the general structure and two concrete examples with different subexpressions.

-Constants

-Variables

-Unary operators

-Binary operators

-If-then-else

If
$$x = 5$$
 then "H" $e(5e 3.14)$

= (5)

Pattern matching 'a list

Metch L with

 $|[] -]$ "Helle"

 $|[] -]$ "Helle"

 $|[] -]$ "From"

-Function definition

-Function application

- Variable binding

let a = fun x y -> x + 2 in (a 3 8) :: [] iat List

7 [5]

```
((fun x -> x::[]) (9 - 5), true, ('a', 7))
\begin{cases} int \left(ist * boo(*(char^*int)) / a - ialt t \right) \end{cases}
    lunx oxiii
                                                     ('a',7)
                                                                        cher * int
   (Punx-) x=:[] (9-5)
```

Week 05 Tutorial 02 -- What Is the Point

What's the point?

Using what you learned about tuple types in the lecture, implement functionality for computing with three-dimensional vectors.

1. O Define a suitable data type for your point. 1 of 1 tests passing

The type vector3 should be a tuple of 3 float values.

2. O Define three points 1 of 1 tests passing

The points p1, p2 and p3 should all be different, but their exact values don't matter. Use them, along with other points, to test your functions.

3. string_of_vector3 1 of 1 tests passing

Implement a function string_of_vector3 : vector3 -> string to convert a vector into a human-readable representation.

For example, the string for the zero vector should be: (0., 0., 0.).

Hint: use string_of_float to convert components.

4. vector3_add 1 of 1 tests passing

Write a function vector3_add: vector3 -> vector3 -> vector3 that adds two vectors component-wise.

5. vector3_max 1 of 1 tests passing

Write a function vector3_max: vector3 -> vector3 that returns the larger argument vector (the vector with the greater magnitude).

6. combine 1 of 1 tests passing

Write a function combine: vector3 -> vector3 -> vector3 -> string that adds its first argument to the larger of the other two arguments and returns the result as a string.

Week 05 Tutorial 03 -- Student Database

Student Database

In this assignment, you have to manage the students of a university.

1. Type 1 of 1 tests passing

First you need to define some types.

• Define a data type for a student.

A student should be represented as a record of the students first_name, last_name, identification number id, number of the current semester as well as the list of grades received in different courses.

The grades should be a pair of the course number and the grade value, a floating point number.

- o To actually manage student you need a database which shall be represented as a list of students.
- 2. insert 1 of 1 tests passing

Write a function insert: student -> database -> database that inserts a student into the database.

3. find_by_id 1 of 1 tests passing

Write a function find_by_id: int -> database -> student list that returns a list with all students with the given id (either a single student or an empty list, if no such student exists).

4. find_by_last_name 1 of 1 tests passing

Implement a function find_by_last_name : string -> database -> student list to find all students with a given last name.
